Explanatory Note

Fund Performance Comparison

The performance comparison is measured as the change in value of an investment in one unit with immediate reinvestment of any distributions. The net asset value of the unit at the measurement date, the return and the emission price at the distribution dates are taken into account in the measurement of performance. Issue prices per unit were used until december 2003 for foundations that charge a commission. The change towards net asset values since January 2004 affects the funds of Allianz Suisse, Credit Suisse, IST and Swisscanto (former Prevista). Therefore all the performance data is based on NAVs since January 2004.

The performance is measured over YTD (current year), 1, 3, 5 and 10 years as of indicated date in the report. The report as of 31 December shows the current year, the precedent year, 3, 5 and 10 years. The indicated performance figures are annualised returns (stated in %, geometric means), except for the current year, where it is the rate of return for the period (not annualised).

For each asset class, the average performance is the unweighted arithmetic mean. Performance results are compared only within homogeneous groups of funds. The LOB balanced funds are separated into 4 categories according to their strategic equity allocation. In addition, all of the compared LOB balanced funds have to be compliant with the specific LOB (OOB2) investment limits.

Real Estate Investment Foundations

NAV-based real estate investment foundations report regularly updated NAV estimations. Non-NAV based performance figures, on the other hand, are based on market data.

The performance calculation for investment foundations without monthly publication of data is based on an approximation formula to avoid large annual performance steps. A fraction of the last paid dividend or the budgeted dividend is added on a monthly basis, what gives an estimated hypothetic performance. The audited net asset value is used at the end of the financial year, to calculate performance and may cause performance to be corrected. Estimated performance is not related to the actual price of shares.

Fluctuations in the net asset value of real estate investment foundation shares reflect only part of the risks involved in real estate investment. Therefore the report does not show volatility figures for real estate investment foundations.

Risk Calculation

Risk is measured by the annualised standard deviation of the monthly rates of return. The annualised standard deviation is calculated as the multiplication of the monthly standard deviation times the square root of 12. For the calculation of the monthly return the end of the monthly net asset values are applied.

Fund Assets

For each product a single asset size is stated. All values are in Mio. CHF and are declared by the providers.
